Project title	Implement Client Script & UI Policy (Incident)

Problem Statement

Incident records in ServiceNow require accurate and complete information for effective triage, assignment, and resolution. When users enter data manually, required fields may be left empty or inconsistent values may be submitted. This can affect incident handling, data quality, and service efficiency. Therefore, UI Policies and Client Scripts are needed to apply conditional field behavior, automate urgency updates, and validate records before submission.

Project Idea

The project idea is to improve Incident form data quality in ServiceNow using UI Policies and Client Scripts. A UI Policy named “High Impact Control” applies rules when the Impact field is set to High. It makes Assignment Group mandatory and makes Urgency read-only. An onChange Client Script automatically sets Urgency to High when Impact is High. An onSubmit Client Script prevents an Incident from being saved when Impact is High and Assigned To is empty. An onCellEdit Client Script blocks direct State changes through list editing and asks users to open the Incident record.

Objective

The objective of this project is to use ServiceNow UI Policies and Client Scripts to enforce consistent data entry and improve Incident form behavior. The solution aims to:

1. Make Assignment Group mandatory when Impact is High.
2. Control the Urgency field by making it read-only under the defined high-impact condition.
3. Automatically set Urgency to High when Impact changes to High.
4. Prevent saving a high-impact Incident when Assigned To is empty.
5. Block direct State changes through list editing while allowing updates from the Incident form.
6. Improve data consistency and reduce avoidable data-entry errors.

User Story

As a ServiceNow incident handler, I want the Incident form to enforce the required field rules and automatically apply the correct urgency behavior, so that high-impact Incidents contain the necessary assignment information and are handled consistently. I also want State changes to be made through the Incident form rather than direct list editing, helping maintain reliable incident records.

Expected Outcome

The expected outcome is an Incident form that applies the configured rules whenever users create or update records. High-impact Incidents will require an Assignment Group, Urgency will be controlled and automatically set according to the configured behavior, and saving will be blocked if Assigned To is missing. Direct State changes through list editing will also be blocked by the configured onCellEdit Client Script. These controls are expected to improve data quality, consistency, and the reliability of Incident management in ServiceNow.

Key ServiceNow Features

- Incident Management
- UI Policy and UI Policy Actions
- Client Scripts: onChange, onSubmit, and onCellEdit
- Form validation and conditional field behavior
