PROJECT DESIGN PHASE

Implement Client Script & UI Policy (Incident)

Team ID	SWTID-2026-4280

Project title	Implement Client Script & UI Policy (Incident)

Design Overview

The project is designed to improve data quality and control user actions on Incident records in ServiceNow. A UI Policy applies field rules when the Impact field is set to High, while Client Scripts handle automatic urgency updates, save-time validation, and list-edit restrictions. Together, these controls help users enter consistent information and follow the required Incident management process.

UI Policy Design

The UI Policy is named “High Impact Control” and applies to the Incident table. It is active and uses the condition Impact is 1 – High. When the condition is true, the Assignment Group field is made mandatory. The UI Policy Action for Urgency makes the field read-only. The “Reverse if false” option is enabled so the policy changes are reversed when the Impact condition is no longer met.

Client Script Design

Three Client Scripts are planned for the Incident table. The onChange script runs when the Impact field changes and sets Urgency to High when Impact is High. The onSubmit script checks whether Impact is High and Assigned To is empty; if both conditions are true, it displays an error and prevents the record from being saved. The onCellEdit script is associated with the State field and blocks direct State changes through list editing, prompting the user to open the Incident record.

Validation Design

The validation design checks that high-impact Incidents have the required assignment information and that the configured field behavior works as expected. Testing includes saving a high-impact Incident with Assigned To empty, saving it after selecting an assignee, changing Impact from High to Medium, attempting to edit State in the list, and updating State from the Incident form.

Interaction Flow

The designed interaction flow is: a user opens or creates an Incident → sets Impact to High → the UI Policy makes Assignment Group mandatory and Urgency read-only → the onChange Client Script sets Urgency to High → when the user submits the record, the onSubmit Client Script checks Assigned To → if Assigned To is empty, the save is blocked with an error; otherwise, the record can be saved → if the

user tries to change State directly in the list, the onCellEdit Client Script blocks the change and asks the user to open the Incident.

Expected Design Result

The design provides a consistent set of interface rules for Incident records. It is expected to reduce incomplete submissions, automate the urgency setting for high-impact Incidents, and guide users to update State through the Incident form. The configured behavior will be confirmed during the testing phase.
