PROJECT PLANNING PHASE

Implement Client Script & UI Policy (Incident)

Team ID	SWTID-2026-4280
Team Leader	S. Vembudurai
Team Member	P.Vairamuthu
Project title	Implement Client Script & UI Policy (Incident)

Implementation Plan

The project will be implemented through a sequence of ServiceNow configuration tasks. Each UI Policy and Client Script will be configured and verified before moving to the next task.

Milestone 1 – Create UI Policy

Open System UI → UI Policies and create a new UI Policy named “High Impact Control” for the Incident table. Set the policy to Active and configure the condition Impact is 1 – High. Enable “Reverse if false” so the policy actions are reversed when the condition is no longer true. Add a UI Policy Action to make Assignment Group mandatory.

Milestone 2 – Configure Urgency UI Policy Action

Open the “High Impact Control” UI Policy and add a UI Policy Action for the Urgency field. Set Read-only to true and leave Visible unchanged. Save the action and verify that Urgency becomes read-only when Impact is High and returns to its normal behavior when the condition is false.

Milestone 3 – Create onChange Client Script

Open System UI → Client Scripts and create an active Client Script for the Incident table. Set Type to onChange and Field name to Impact. Configure the script to set Urgency to High when Impact changes to High, and display an informational message.

Milestone 4 – Create onSubmit Client Script

Create an active onSubmit Client Script for the Incident table. Configure it to check whether Impact is High and Assigned To is empty. If both conditions are true, show an error beside Assigned To and return false to prevent the record from being saved. Otherwise, allow submission.

Milestone 5 – Create onCellEdit Client Script

Create an active onCellEdit Client Script for the Incident table and associate it with the State field. Configure it to display an alert and reject direct State changes made through list editing, prompting users to open the Incident record to update the State.

Milestone 6 – Testing and Verification

Test a High Impact Incident with Assigned To left empty and confirm that saving is blocked with an error. Select an assignee and verify that the record saves. Change Impact from High to Medium and check that the UI Policy reverses its field behavior. Try changing State directly in the list and confirm that the change is rejected, then update State through the Incident form and verify that the form-based update is saved.

Milestone 7 – Record Results

Record the result of each test and capture screenshots of the UI Policy, UI Policy Actions, Client Scripts, error message, successful save, reversed condition, and State list-edit restriction. Use these results to confirm whether the configured Incident controls behave as intended.
