Project Development Phase

Implement Client Script & UI Policy (Incident)

Team ID	SWTID-2026-4280

Project title	Implement Client Script & UI Policy (Incident)

In the development phase, I configured the ServiceNow Incident form using UI Policies and Client Scripts. First, I created a UI Policy named “High Impact Control” for the Incident table and set the condition to Impact = High. I enabled the “Reverse if false” option to reverse the policy behavior when the condition was no longer satisfied. I then configured a UI Policy Action to make the Urgency field read-only for High impact incidents. Next, I created an onChange Client Script to automatically set Urgency to High when the Impact field was changed to High. I also created an onSubmit Client Script to check whether the Assigned To field was empty. If it was empty for a High impact incident, the script displayed an error message and prevented submission. Finally, I created an onCellEdit Client Script to prevent users from changing the State field directly from the Incident list. Through these configurations, I implemented automatic field updates, validation, and field behavior control in ServiceNow.
