Requirement Analysis Phase

Implement Client Script & UI Policy (Incident)

Team ID	SWTID-2026-4280
Team Leader	S. Vembudurai
Team Member	P.Vairamuthu
Project title	Implement Client Script & UI Policy (Incident)

Functional Requirements The ServiceNow configuration must enforce data quality directly on the Incident form. When the Impact of an Incident is set to High, the form must automatically make Assignment group mandatory, make Urgency read-only, and set Urgency to High. The record must not be saved if Assigned To is empty for a High impact Incident. Users must also be prevented from changing the State field directly from the Incident list view, while changes made through the form must remain allowed. UI Policy Requirements A UI Policy with the short description High Impact Control must be created on the Incident table. It must be active and must apply when the condition Impact is 1 - High is met. The Reverse if false option must be selected, so that the changes made by the policy are undone automatically when Impact is changed to any other value. The policy must be saved using Submit. UI Policy Action Requirements Two UI Policy Actions must be added to the High Impact Control policy. The first action must target the Assignment group field and set Mandatory to True. The second action must target the Urgency field and set Read only to True. The Visible setting must be left unchanged for both actions, so that the fields remain visible on the form. Client Script Requirements Three Client Scripts must be created on the Incident table, and all must be active

1. onChange script: named Auto set urgency for high impact, running on the Impact field. When Impact changes to 1 (High), it must set Urgency to 1 and display an information message. It must not run while the form is loading or when the new value is empty.

2.onSubmit script: named Prevent save if Assigned To missing. When Impact is 1 (High) and Assigned To is empty, it must show an error message on the Assigned To field and return false so the record is not saved. Otherwise it must return true.

3.state change via list edit, running on the State field. It must display an alert that State cannot be updated using list editing and cancel the change by calling the callback with false. Validation Requirements The solution must be tested on both the form and the list. On a new Incident with Impact set to High, Urgency must be set to High and become read-only, Assignment group must be mandatory, and submitting without Assigned To must be blocked with an error message. After Assigned To is filled, the Incident must save successfully. When Impact of an existing Incident is changed from High to Medium, Urgency must become editable again and the mandatory requirement must be removed. In the Incident list, double clicking State must show the alert and leave the value unchanged, while changing State from the Incident form must save successfully. Skills and Technologies The project requires knowledge of ServiceNow Incident Management, UI Policies, UI Policy Actions, Client Scripts (onChange, onSubmit, and onCellEdit), the g_form client side API, and form validation. A modern web browser and access to a ServiceNow instance with administrative or configuration roles are also needed to implement and test the solution.
